

# Using Citizen Science Observations to Validate 21 Habitat Suitability Models in Wisconsin

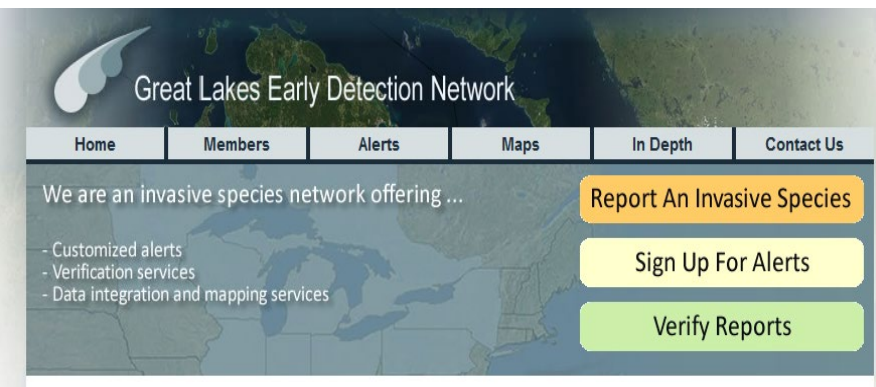

THE UNIVERSITY  
of  
**WISCONSIN**  
MADISON

Mark Renz & Niels Jorgensen  
University of Wisconsin-Madison

<sup>LW</sup>  
**Extension**  
University of Wisconsin-Extension

Wouldn't be possible without the development  
of previous resources and networks

# Wisconsin has a large number of regulated invasive species

- Over 145 invasive plants are regulated
  - 68 are prohibited = **must control**
  - 63 are restricted
    - recommend control
    - can't move propagules to un-infested areas
  - 14 are split listed
    - prohibited where uncommon/absent
    - restricted where common

# Large # of regulated plants challenge land managers ability to identify and monitor for

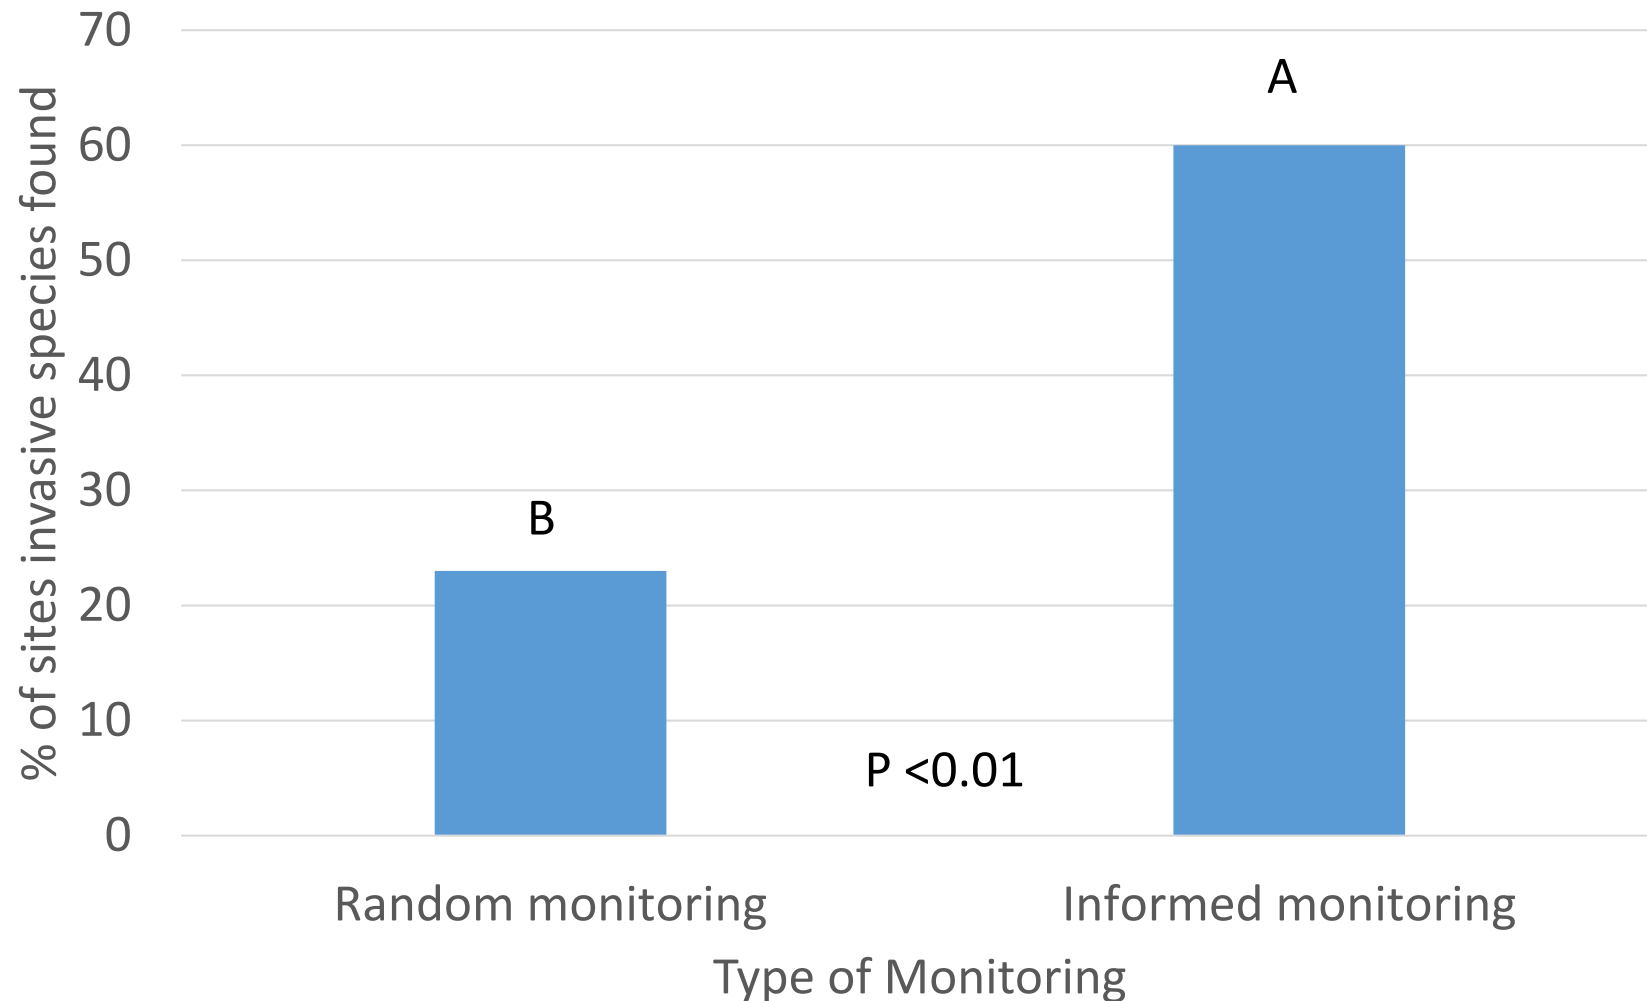

- Resources have been made to help with ID
- Land managers want tools to help prioritize monitoring efforts

# Habitat suitability models can help improve monitoring efforts

- Using a model to inform monitoring for 1 invasive species can improve success rate

- Crall et al. 2013

# Funded to create 21 habitat suitability models for WI regulated plants

- Ensemble modeling approach using 5 models
  - boosted regression tree (BRT), generalized linear model (GLM), multivariate adaptive regression splines (MARS), maximum entropy (MaxEnt), random forests (RF)
- Observations
  - Existing databases (Great Lakes Early Detection Network, EDDMapS, WI DNR)
  - Citizen scientists (data verified)
- Used common environmental, topographic, and climactic conditions available for geo-referenced locations.

# Utilized Iterative Approach

# How well did the iterative approach work?

Common Name	Scientific Name	inc	Total
Garlic mustard	<i>Allaria petiolata</i>	44%	3,520
Japanese barberry	<i>Berberis thunbergii</i>	13%	474
<b>Oriental bittersweet</b>	<b><i>Celastrus orbiculatus</i></b>	<b>4%</b>	<b>223</b>
Spotted knapweed	<i>Centaurea stoebe</i>	37%	6,899
<b>European marsh thistle</b>	<b><i>Cirsium palustre</i></b>	<b>59%</b>	<b>1,369</b>
Teasels	<i>Dipsacus spp.</i>	3%	1,541
Autumn olive	<i>Elaeagnus umbellata</i>	59%	156
Leafy spurge	<i>Euphorbia esula</i>	106%	698
<b>Knotweeds</b>	<b><i>Fallopia spp.</i></b>	<b>17%</b>	<b>1,069</b>
Bush honeysuckles	<i>Lonicera spp.</i>	27%	3,943

14,314  
more points  
(37%  
increase)

Common Name	Scientific Name	inc	Total
Purple loosestrife	<i>Lythrum salicaria</i>	17%	1,642
Wild parsnip	<i>Pastinaca sativa</i>	18%	8,139
Canada thistle	<i>Cirsium arvense</i>	-	4,250
<b>Phragmites</b>	<b><i>Phragmites australis</i></b>	<b>1%</b>	<b>5,529</b>
Common buckthorn	<i>Rhamnus cathartica</i>	63%	1,673
Glossy buckthorn	<i>Rhamnus frangula</i>	12%	753
Wild chervil		-	613
Crown vetch	<i>Securigera varia</i>	36%	988
Tansy	<i>Tanacetum vulgare</i>	148%	10,778
<b>Hedgeparsleys</b>	<b><i>Torilis spp.</i></b>	<b>12%</b>	<b>509</b>
Garden valerian	<i>Valeriana officinalis</i>	5%	506

# Did the iterative process improve models?

## AUC values

**Leafy Spurge model  
(2015)**

**Leafy spurge model  
(2016)**

**Purple loosestrife model  
(2015)**

**Purple loosestrife model  
(2016)**

# We wanted to field validate, but how?

- Past experiences we used experts and staff
  - Only focused on two species, had a grant to help fund students
- How to collect data on 20+ species in one summer across Wisconsin?

# *Wisconsin First Detector Network (WIFDN)*

**ESTABLISHED 2013**

A statewide citizen science  
network for invasive  
species detection and  
education

<http://fyi.uwex.edu/wifdn>

# WIFDN Impacts 2014-2017

**9620**  
reported  
volunteer  
hours

**7272**  
invasive  
species  
reports

**9286**  
miles driven to  
volunteer  
activities

**443**  
baseball diamonds surveyed  
for *Cerceris* wasps

**1004**  
insects collected, **75** EAB  
from 2014-2015

# Objectives:

- Field validate 21 habitat suitability models for invasive species
  1. Across all species
  2. Within each species

# Methods for field validation

- Independent dataset from citizen scientists in summer 2017
  - Submitted via the Great Lakes Early Detection App

EDD MapS

Early Detection & Distribution Mapping System

# Reports

- 3,916 reports
  - 89% of Wisconsin counties reported at least one
  - 2,937 were used
    - Excluded if in novel areas or within road networks
- Calculated the % correct/incorrect classification for each species
  - Compared ensemble for
    - All species
      - Early detection species
      - Widespread species
    - Each species

# What Habitat Suitability Models look like

Models run at 30 m resolution

Phragmites

Wild Parsnip

# Converting Models into Binary maps (Ensemble)

**Phragmites**

**Wild Parsnip**

# Percent of observations that were classified correct/incorrect as suitable habitat

Ensemble (*at least one model correct*)

# Percent correctly classified by species (ensemble)

\* Chi square or Fisher's exact test

# Summary

- Correctly classified invasive plant locations > 80%
  - Early detection > 95%
- Individual species
  - 12 species were correct > 80%
  - 5 species were similar to 80% expected correct
  - 4 species were worse than 80%
- Future efforts will include 2018 data in analysis

# Summary

- Citizen Scientists can help!
- WIFDN has been a great partnership to improving our understanding of invasive plant presence and suitable habitats in Wisconsin

# Funding
